Project Starting Requirements

Make an environment to run the Django python project. You can use simple commands for it or use anaconda environment simply.

```
mkdir djangoenv  | python3 -m venv djangoenv  | source djangoenv/bin/activate
```

After that you need to install the requirements.txt file available in the project and it will install all the dependencies.

API End points

http://127.0.0.1:8000/auth/users/ for signup using tokens

http://127.0.0.1:8000/auth/token/login for login using tokens

http://127.0.0.1:8000/found_items will show all found items
